# Calculating the inverse using row operations

v. 1.24

## PROBLEM

Find (if possible) the inverse of the matrix

$$\begin{bmatrix} 3 & 2 \\ -1 & 1 \end{bmatrix}$$

## SOLUTION

- [Step 1: Adjoin the identity matrix to the given matrix](#)
- [Step 2: Transform the matrix to the reduced row echelon form](#)
- [Step 3: Interpret the reduced row echelon form](#)
- [Comments](#)

### Step 1: Adjoin the identity matrix to the given matrix

Adjoining  $I_2$  to the given matrix, we obtain the  $2 \times 4$  matrix:

$$\begin{bmatrix} 3 & 2 & 1 & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix}$$

### Step 2: Transform the matrix to the reduced row echelon form ([Hide details](#))

Row  
Operation  
1:

$$\begin{bmatrix} 3 & 2 & 1 & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix}$$

multiply the 1st row by  $1/3$

$$\begin{bmatrix} 1 & \frac{2}{3} & \frac{1}{3} & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix}$$

Row  
Operation  
2:

$$\begin{bmatrix} 1 & \frac{2}{3} & \frac{1}{3} & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix}$$

add 1 times the 1st row to the 2nd row

$$\begin{bmatrix} 1 & \frac{2}{3} & \frac{1}{3} & 0 \\ 0 & \frac{5}{3} & \frac{1}{3} & 1 \end{bmatrix}$$

Row  
Operation  
3:

$$\begin{bmatrix} 1 & \frac{2}{3} & \frac{1}{3} & 0 \\ 0 & \frac{5}{3} & \frac{1}{3} & 1 \end{bmatrix}$$

multiply the 2nd row by  $3/5$

$$\begin{bmatrix} 1 & \frac{2}{3} & \frac{1}{3} & 0 \\ 0 & 1 & \frac{1}{5} & \frac{3}{5} \end{bmatrix}$$

**Row Operation 4:**

$$\left[ \begin{array}{cc|cc} 3 & 3 & 0 & 0 \\ 2 & 1 & 0 & 0 \\ 3 & 3 & 0 & 0 \\ 0 & 1 & 1 & 3 \\ 5 & 5 & 5 & 5 \end{array} \right]$$

add  $-\frac{2}{3}$  times the 2nd row to the 1st row

$$\left[ \begin{array}{cc|cc} 1 & 0 & 1 & -2 \\ 2 & 1 & 0 & 0 \\ 3 & 3 & 0 & 0 \\ 0 & 1 & 1 & 3 \\ 5 & 5 & 5 & 5 \end{array} \right]$$

### Step 3: Interpret the reduced row echelon form

The matrix in reduced row echelon form obtained above can be interpreted as  $[C \mid D]$ , where both  $C$  and  $D$  are  $2 \times 2$  matrices.

Since  $C = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  equals  $I_2$

then  $D = \begin{bmatrix} 1 & -2 \\ 5 & 5 \\ 1 & 3 \\ 5 & 5 \end{bmatrix}$  is the **inverse** of the original matrix.

### Comments

- **Shortcut:** To decide whether the matrix is invertible (without actually determining its inverse), stop the row operations as soon as the pattern of leading entries is established. If every column of the left half has a leading entry, the matrix is invertible; otherwise, it is singular.
