3.1 Using Data Types

A Foundation for Programming

Data Types

Data type. Set of values and operations on those values.

Primitive types. Ops directly translate to machine instructions.

Data Type	Set of Values	Operations
boolean	true, false	not, and, or, xor
int	-2 ³¹ to 2 ³¹ - 1	add, subtract, multiply
double	any of 264 possible reals	add, subtract, multiply

We want to write programs that process other types of data.

- Colors, pictures, strings, input streams, ...
- Complex numbers, vectors, matrices, polynomials, ...
- Points, polygons, charged particles, celestial bodies, ...

Objects

Object. Holds a data type value; variable name refers to object.

Impact. Enables us to create our own data types; define operations on them; and integrate into our programs.

Data Type	Set of Values	Operations
Color	24 bits	get red component, brighten
Picture	2D array of colors	get/set color of pixel (i, j)
String	sequence of characters	length, substring, compare

Constructors and Methods

To construct a new object: Use keyword new and name of data type.

To apply an operation: Use name of object, the dot operator, and the name of the method.

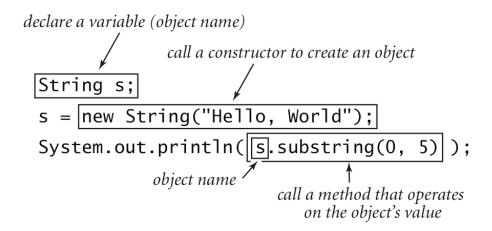

Image Processing

Color Data Type

Color. A sensation in the eye from electromagnetic radiation.

Set of values. [RGB representation] 256³ possible values, which quantify the amount of red, green, and blue, each on a scale of 0 to 255.

R	G	В	Color
255	0	0	
0	255	0	
0	0	255	
255	255	255	
0	0	0	
255	0	255	
105	105	105	

Color Data Type

Color. A sensation in the eye from electromagnetic radiation.

Set of values. [RGB representation] 256³ possible values, which quantify the amount of red, green, and blue, each on a scale of 0 to 255.

API. Application Programming Interface.

```
public class java.awt.Color
```

```
Color(int r, int g, int b)

int getRed() red intensity

int getGreen() green intensity

int getBlue() blue intensity

Color brighter() brighter version of this color

Color darker() darker version of this color

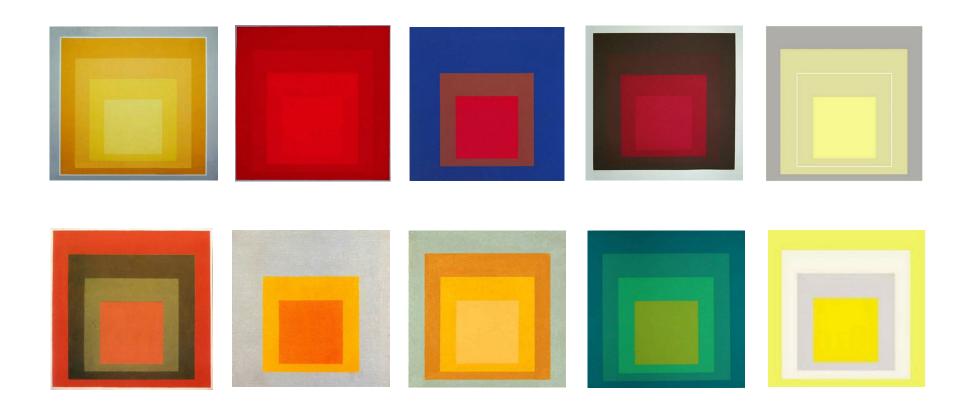

String toString() string representation of this color

boolean equals(Color c) is this color's value the same as c's?
```

http://download.oracle.com/javase/6/docs/api/java/awt/Color.html

Albers Squares

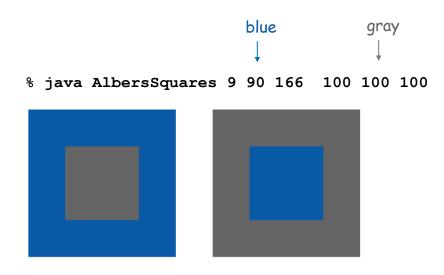

Josef Albers. Revolutionized the way people think about color.

Homage to the Square by Josef Albers (1949-1975)

Albers Squares

Josef Albers. Revolutionized the way people think about color.

Using Colors in Java

```
import java.awt.Color;
                                           to access Color library
public class AlbersSquares {
   public static void main(String[] args) {
      int r1 = Integer.parseInt(args[0]);
      int g1 = Integer.parseInt(args[1]);
                                                     first color
      int b1 = Integer.parseInt(args[2]);
      Color c1 = new Color(r1, g1, b1);
      int r2 = Integer.parseInt(args[3]);
      int g2 = Integer.parseInt(args[4]);
                                                   second color
      int b2 = Integer.parseInt(args[5]);
      Color c2 = new Color(r2, g2, b2);
      StdDraw.setPenColor(c1);
                                                   first square
      StdDraw.filledSquare(.25, .5, .2);
      StdDraw.setPenColor(c2);
      StdDraw.filledSquare(.25, .5, .1);
      StdDraw.setPenColor(c2);
      StdDraw.filledSquare(.75, .5, .2);
                                                  second square
      StdDraw.setPenColor(c1);
      StdDraw.filledSquare(.75, .5, .1);
```

Monochrome Luminance

Monochrome luminance. Effective brightness of a color.

NTSC formula. Y = 0.299r + 0.587g + 0.114b.

```
import java.awt.Color;

public class Luminance {
    public static double lum(Color c) {
        int r = c.getRed();
        int g = c.getGreen();
        int b = c.getBlue();
        return .299*r + .587*g + .114*b;
    }
}
```

Color Compatibility

- Q. Which font colors will be most readable with which background colors on computer and cell phone screens?
- A. Rule of thumb: difference in luminance should be \geq 128.

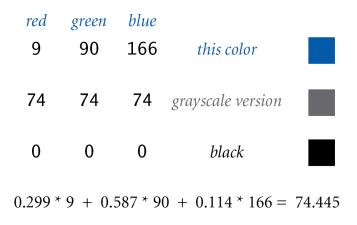

```
public static boolean compatible(Color a, Color b) {
   return Math.abs(lum(a) - lum(b)) >= 128.0;
}
```

Grayscale

Grayscale. When all three R, G, and B values are the same, resulting color is on grayscale from 0 (black) to 255 (white).

Convert to grayscale. Use luminance to determine value.

```
public static Color toGray(Color c) {
  int y = (int) Math.round(lum(c));
  Color gray = new Color(y, y, y);
  return gray;
}
```

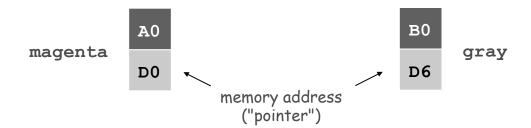

Bottom line. We are writing programs that manipulate color.

OOP Context for Color

Possible memory representation.

D0	D1	D2	D3	D4	D5	D6	D7	D8
255	0	255	0	0	0	105	105	105

Object reference is analogous to variable name.

- We can manipulate the value that it holds.
- We can pass it to (or return it from) a method.

References

René Magritte. "This is not a pipe."

Java. This is not a color.

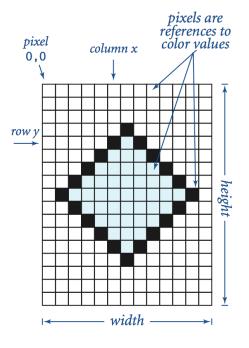

```
Color sienna = new Color(160, 82, 45);
Color c = sienna.darker();
```

OOP. Natural vehicle for studying abstract models of the real world.

Picture Data Type

Raster graphics. Basis for image processing.

Set of values. 2D array of color objects (pixels).

API.

public class Picture

```
Picture(String filename)
    Picture(int w, int h)
    int width()
    int height()

Color get(int x, int y)
    void set(int x, int y, Color c)
    void show()
    void save(String filename)
```

create a picture from a file create a blank w-by-h picture return the width of the picture return the height of the picture return the color of pixel (x, y)set the color of pixel (x, y) to Cdisplay the image in a window save the image to a file

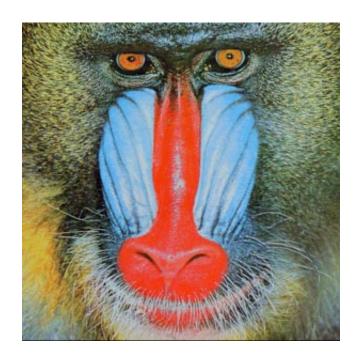

Image Processing: Grayscale Filter

Goal. Convert color image to grayscale according to luminance formula.

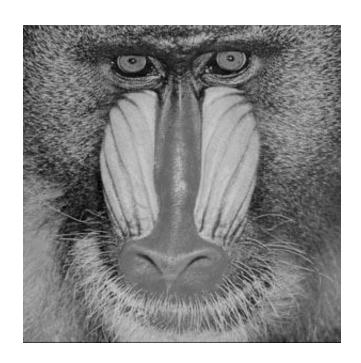

```
import java.awt.Color;
public class Grayscale {
   public static void main(String[] args) {
      Picture pic = new Picture(args[0]);
      for (int x = 0; x < pic.width(); x++) {
         for (int y = 0; y < pic.height(); y++) {
            Color color = pic.get(x, y);
            Color gray = Luminance.toGray(color); ← from before
            pic.set(x, y, gray);
      pic.show();
```

Image Processing: Grayscale Filter

Goal. Convert color image to grayscale according to luminance formula.

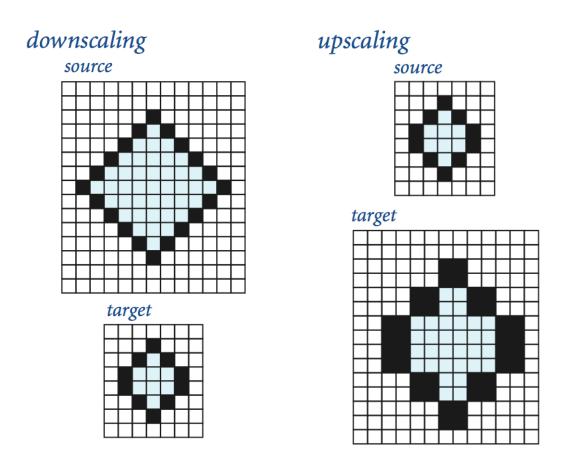

mandrill.jpg

% java Grayscale mandrill.jpg

Goal. Shrink or enlarge an image to desired size.

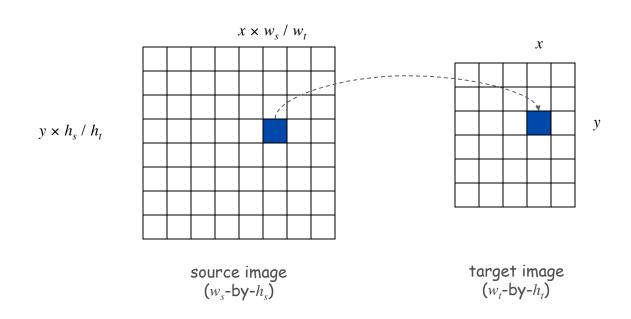

Downscaling. To shrink, delete half the rows and columns. Upscaling. To enlarge, replace each pixel by 4 copies.

Goal. Shrink or enlarge an image to desired size.

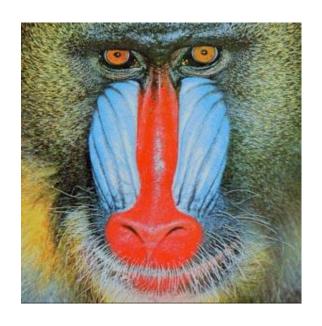

Uniform strategy. To convert from w_s -by- h_s to w_t -by- h_t :

- Scale column index by w_s / w_t .
- Scale row index by h_s / h_t .
- Set color of pixel (x, y) in target image to color of pixel $(x \times w_s / w_t, y \times h_s / h_t)$ in source image.

```
import java.awt.Color;
public class Scale {
   public static void main(String[] args) {
      String filename = args[0];
      int w = Integer.parseInt(args[1]);
      int h = Integer.parseInt(args[2]);
      Picture source = new Picture(filename);
      Picture target = new Picture(w, h);
      for (int tx = 0; tx < target.width(); tx++) {</pre>
         for (int ty = 0; ty < target.height(); ty++) {</pre>
            int sx = tx * source.width() / target.width();
            int sy = ty * source.height() / target.height();
            Color color = source.get(sx, sy);
            target.set(tx, ty, color);
     source.show();
     target.show();
```

Scaling filter. Creates two Picture objects and two windows.

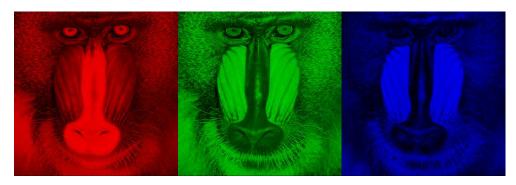

mandrill.jpg
(298-by-298)

% java Scale mandrill.jpg 400 200

More Image Processing Effects

RGB color separation

Text Processing

String Data Type

String data type. Basis for text processing.

Set of values. Sequence of Unicode characters.

API. public class String (Java string data type)

```
String(String s)
                                                   create a string with the same value as S
      int length()
                                                   string length
     char charAt(int i)
                                                   ith character
  String substring(int i, int j)
                                                   ith through (j-1)st characters
 boolean contains(String sub)
                                                   does string contain sub as a substring?
 boolean startsWith(String pre)
                                                   does string start with pre?
 boolean endsWith(String post)
                                                   does string end with post?
      int indexOf(String p)
                                                   index of first occurrence of p
      int indexOf(String p, int i)
                                                   index of first occurrence of p after i
  String concat(String t)
                                                   this string with t appended
      int compareTo(String t)
                                                   string comparison
  String replaceAll(String a, String b)
                                                  result of changing as to bs
String[] split(String delim)
                                                   strings between occurrences of delim
 boolean equals(String t)
                                                   is this string's value the same as t's?
```

Typical String Processing Code

```
public static boolean isPalindrome(String s)
                         int N = s.length();
    is the string
                         for (int i = 0; i < N/2; i++)
                            if (s.charAt(i) != s.charAt(N-1-i))
   a palindrome?
                                return false;
                         return true;
                     }
  extract file name
                     String s = args[0];
                     int dot = s.index0f(".");
and extension from a
                     String base
                                        = s.substring(0, dot);
   command-line
                      String extension = s.substring(dot + 1, s.length());
     argument
                     String query = args[0];
  print all lines in
                     while (!StdIn.isEmpty())
 standard input that
   contain a string
                         String s = StdIn.readLine();
   specified on the
                         if (s.contains(query)) StdOut.println(s);
   command line
                      }
                     while (!StdIn.isEmpty())
print all the hyperlinks
                      {
(to educational institu-
                         String s = StdIn.readString();
                         if (s.startsWith("http://") && s.endsWith(".edu"))
tions) in the text file on
                            StdOut.println(s);
   standard input
                     }
```

Gene Finding

Pre-genomics era. Sequence a human genome.

Post-genomics era. Analyze the data and understand structure.

Genomics. Represent genome as a string over { A, C, T, G } alphabet.

Gene. A substring of genome that represents a functional unit.

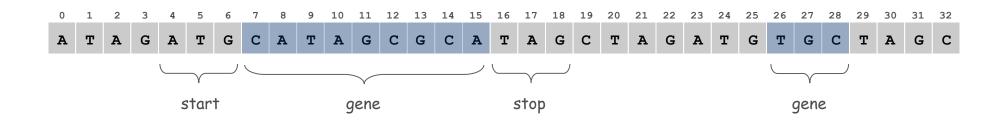

- Preceded by ATG.
- Multiple of 3 nucleotides.
- Succeeded by TAG, TAA, or TGA.

[start codon]

[codons other than start/stop]

[stop codons]

Goal. Find all genes.

Gene Finding: Algorithm

Algorithm. Scan left-to-right through genome.

- If start codon, then set beg to index i.
- If stop codon and substring is a multiple of 3
 - output gene
 - reset beg to -1

i .	COC	don	beg gene		remaining portion of input string				
	start	stop	beg	gene	remaining portion of infair string				
0			-1		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
1		TAG	-1		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
4	ATG		4	multiple of 3 CATAGCGCA	ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
9		TAG	4		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
16		TAG	4		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
20		TAG	-1		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
23	ATG		23		ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				
29		TAG	23	TGC	ATAGATGCATAGCGCATAGCTAGATGTGCTAGC				

Gene Finding: Implementation

```
public class GeneFind {
   public static void main(String[] args) {
      String start = args[0];
      String stop = args[1];
      String genome = StdIn.readAll();
      int beg = -1;
      for (int i = 0; i < genome.length() - 2; <math>i++) {
         String codon = genome.substring(i, i+3);
         if (codon.equals(start)) beg = i;
         if (codon.equals(stop) && beg != -1) {
            String gene = genome.substring(beg+3, i);
            if (gene.length() % 3 == 0) {
               StdOut.println(gene);
               beg = -1;
                         % more genomeTiny.txt
                         ATAGATGCATAGCGCATAGCTAGATGTGCTAGC
                         % java GeneFind ATG TAG < genomeTiny.txt
                          CATAGCGCA
                          TGC
```

OOP Context for Strings

Possible memory representation of a string.

genome = "aacaagtttacaagc";

D0	D1	D2	D3	D4	D5	D6	D7	D8	D9	DA	DB	DC	DD	DE
a	a	С	a	a	g	t	t	t	a	С	a	a	g	С

A0 A1

D0 15

memory length address

s = genome.substring(1, 5);

t = genome.substring(9, 13);

B0 B1 B2 B3 D1 4

s

t

s and t are different strings that share the same value "acaa"

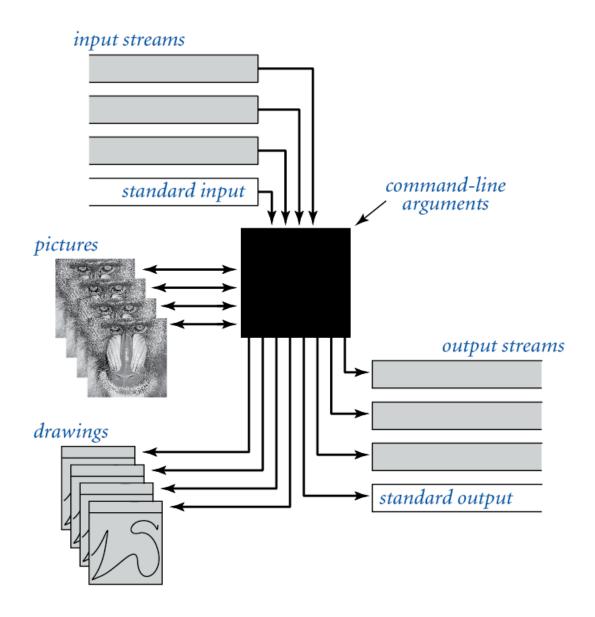

(s == t) is false, but (s.equals(t)) is true.

compares pointers

compares character sequences

In and Out

Bird's Eye View (Revisited)

Non-Standard Input

or use OS to redirect from one file

Standard input. Read from terminal window.

Goal. Read from several different input streams.

In data type. Read text from stdin, a file, a web site, or network.

Ex: Are two text files identical?

Screen Scraping

Goal. Find current stock price of Google.

```
Last Trade:
<biq>
<b>459.52</b>
</big>
Trade Time:
11:45AM ET
```

http://finance.yahoo.com/q?s=goog NYSE symbol

Screen Scraping

Goal. Find current stock price of Google.

- s.indexOf(t, i): index of first occurrence of pattern t in string s, starting at offset i.
- Read raw html from http://finance.yahoo.com/q?s=goog.
- Find first string delimited by and after Last Trade.

```
public class StockQuote {
   public static void main(String[] args) {
      String name = "http://finance.yahoo.com/q?s=";
      In in = new In(name + args[0]);
      String input = in.readAll();
      int start = input.indexOf("Last Trade:", 0);
      int from = input.indexOf("<b>", start);
      int to = input.indexOf("</b>", from);
      String price = input.substring(from + 3, to);
      StdOut.println(price);
   }
}
```

Day Trader

Add bells and whistles.

- Plot price in real-time.
- Notify user if price dips below a certain price.
- Embed logic to determine when to buy and sell.
- Automatically send buy and sell orders to trading firm.

Warning. Please, please use at your own financial risk.

The New Yorker, September 6, 1999

OOP Summary

Object. Holds a data type value; variable name refers to object.

In Java, programs manipulate references to objects.

- Exception: primitive types, e.g., boolean, int, double.
- Reference types: String, Picture, Color, arrays, everything else.
- OOP purist: language should not have separate primitive types.

Bottom line. We wrote programs that manipulate colors, pictures, and strings.

Next time. We'll write programs that manipulate our own abstractions.
