Today's Overview

1 Introduction

2 Column Dominance

3 An example

Quine-McCluskey [Majumder et al., 2015] I

- An exact algorithm which finds a minimum-cost sum-of-products implementation of a Boolean function
- This lecture introduces the method

Quine-McCluskey [Majumder et al., 2015] II

Steps of the Quine-McCluskey algorithm:

1. Generate Prime Implicants
2. Construct Prime Implicant Table
3. Reduce Prime Implicant Table
   1. Remove Essential Prime Implicants
   2. Row Dominance
   3. Column Dominance
4. Solve Prime Implicant Table

Quine-McCluskey [Majumder et al., 2015] III

In Step 1, the prime implicants of a function are generated using an iterative procedure

- You can use a Karnaugh-Map

Reminder

- Any single 1 or group of 1's that can be combined together on a Karnaugh map of the function F represents an *Implicant*
- *Prime Implicant* denotes a product term that we cannot combine with another term to eliminate a variable

Quine-McCluskey [Majumder et al., 2015] IV

In Step 2, a prime implicant table is constructed

- The columns of the table are the prime implicants
- The rows are min-terms of where the function is 1

Our Goal

To cover all the rows using a minimum-cost cover
- Of all prime implicants

# Quine-McCluskey [Majumder et al., 2015] V

This goals needs more explanation..

- *Minimum-cost* means to have fewest prime implicants (i.e. AND gates) in the final solution.

However, the algorithm has been extended to consider more complex cost functions:

- E.g. Minimising the total number of gate inputs, power optimisation, and so on.

Column Dominance I

essential

A B

	00	01	11	10
00	1	1	0	0
01	0	1	1	0
11	0	0	1	1
10	0	0	0	0

CD

essential
Karnaugh map with set of prime implicants:
illustrating "column dominance"

$$f(A, B, C, D) = \sum m(0, 4, 5, 11, 13, 15)$$

Column Dominance II

Karnaugh map with set of prime implicants: illustrating "column dominance"

- There are 5 prime implicants
  - Each covers 2 ON-set min-terms
- First, we note that two implicants are essential prime implicants: $A'C'D'$ and ACD

# Column Dominance III

Karnaugh map with set of prime implicants: illustrating "column dominance"

- These implicants must be added to the final cover
- There are 3 remaining prime implicants
- We must pick a minimum subset of these to cover the uncovered ON-set min-terms

Column Dominance IV

	A'C'D' (0,4)	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

- The prime implicant table for the Karnaugh map
- The 5 prime implicants are listed as columns
- The 6 ON-set min-terms are listed as rows

Column Dominance V

	A'C'D' (0,4)*	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)*
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

- We cross out columns A'C'D' and ACD and mark them with *

(These indicate essential implicants)

Column Dominance VI

	A'C'D' (0,4)*	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)*
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

- Cross out each row intersected by one of these columns
  - Because that min-term is now covered
- At this point, prime implicant BC'D covers 2 remaining ON-set min-terms (5 and 13)

Column Dominance VII

	A'C'D' (0,4)*	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)*
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

- However, prime implicant A'BC' covers only one of these (namely, 5)
  - As does ABD (namely, 13).

Column Dominance VIII

	A'C'D' (0,4)*	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)*
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

- We can use BC'D instead of either A'BC' or ABD
  - Since it covers the same min-terms
  - That is, BC'D column-dominates A'BC, and BC'D column-dominates ABD

Column Dominance IX

	A'C'D' (0,4)*	A'BC' (4,5)	BC'D (5,13)	ABD (13,15)	ACD (11,15)*
0	X				
4	X	X			
5		X	X		
11					X
13			X	X	
15				X	X

The dominated prime implicants can be crossed out, and only
column BC'D remains

16/18

Bored Yet?

We will look at *Row Dominance* next time (zzzzz...)

Any Problems?
